## Research

### Job Market Paper:

It's About Time: Social Housing, Parental Labour Supply, and Long-term Child Outcomes [\[Paper\]](#)

**Abstract:** This paper studies the effect of highly subsidized social housing on both medium-term parental labour market outcomes and long-term child earnings and educational attainment. Using linked Canadian administrative data, I exploit variation in the timing of entry into social housing to identify the effects of additional exposure during childhood and find that children who enter earlier achieve better adult outcomes. For parents, event-study estimates around entry reveal substantial reductions in labour supply and earnings, with nearly no effect on net-of-housing income. A simple time-allocation model—where social housing receipt both relaxes the budget constraint and insures parents against earnings uncertainty—rationalizes these large labour supply responses. Declines in parental labour supply are a key factor behind improvements in child outcomes: gains for children are largest when parents reduce their labour supply the most. This channel is highly robust and appears to be causal, as suggested by an analysis isolating exogenous labour supply responses using displacement distance. These results highlight a critical trade-off between maximizing the return for children and the labour market participation of parents.
